

*I wish that we could calculate
by steam.*

- attributed to Charles Babbage

The computer is a universal machine.

It's a mind-set, not a skill-set. Brilliance helps, but is not required.

Instead, adopt these mantras: be stubborn, **bossy**, lazy, obsessive, cynical, plodding, and importunate. Why? So you can use IT as a tool to do cool stuff...

Computer History

- Computers were developed to mechanize mathematical computations.
- Two definitions:
 - A *computer* is “one [**a human**] who computes; a reckoner; a calculator.” - Webster’s Dictionary, 1828
 - A *computer* is “a **programmable electronic device** that can store, retrieve, and process **data**.” - Merriam-Webster Dictionary, 2000

Manual computing was very important in the 1800’s (industrial revolution) and into the 1900’s (the world wars) because of the use of mathematical tables in navigation, engineering, etc. The tables were also very hard to produce and filled with errors.

A British mathematician named William Shanks spent 28 years of his life calculating Pi to 707 places, finishing in 1873. Soon after his calculations, another mathematician called De Morgan found that Shanks had made an error in the 528th place, after which all his digits were wrong!

The 2 definitions show how the view of computing changed around 1940.

Charles Babbage (1791-1871) “Analytical Engine”

- 1833
- Primary innovation:
 - The **difference engine** was single-purpose
 - The **analytical engine** was *general-purpose*
- Only the difference engine was built, recently.

a recreation of the difference engine

images from <http://www.computer.org/history/>, Oct., 2004
© Keith Vander Linden, 2005
Jeremy D. Frens, 2008

Babbage died an embittered man, having never convinced anyone of the value of his ideas (apart from Ada and a few others - see the next slide)

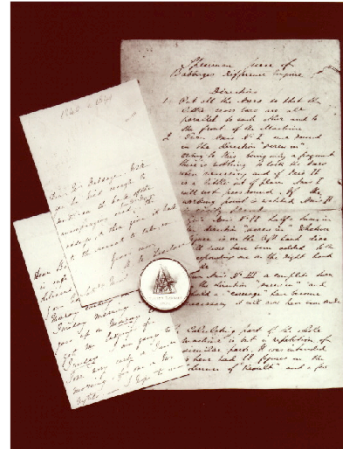

“recently” links to excellent 4 minute video of Difference Engine No. 2 built after 2000

XXX In the video the machine is much bigger. And the picture is from the British museum? I think I saw it there.

Ada Lovelace (1816-1852) “the first programmer”

- Developed a set of “notes” on how to instruct the analytical engine
- Suggested the use of punched cards
- Known as the “first programmer”

images from <http://www.digitalegyptian.com>, 2006
Jeremy D. Frens, 2008

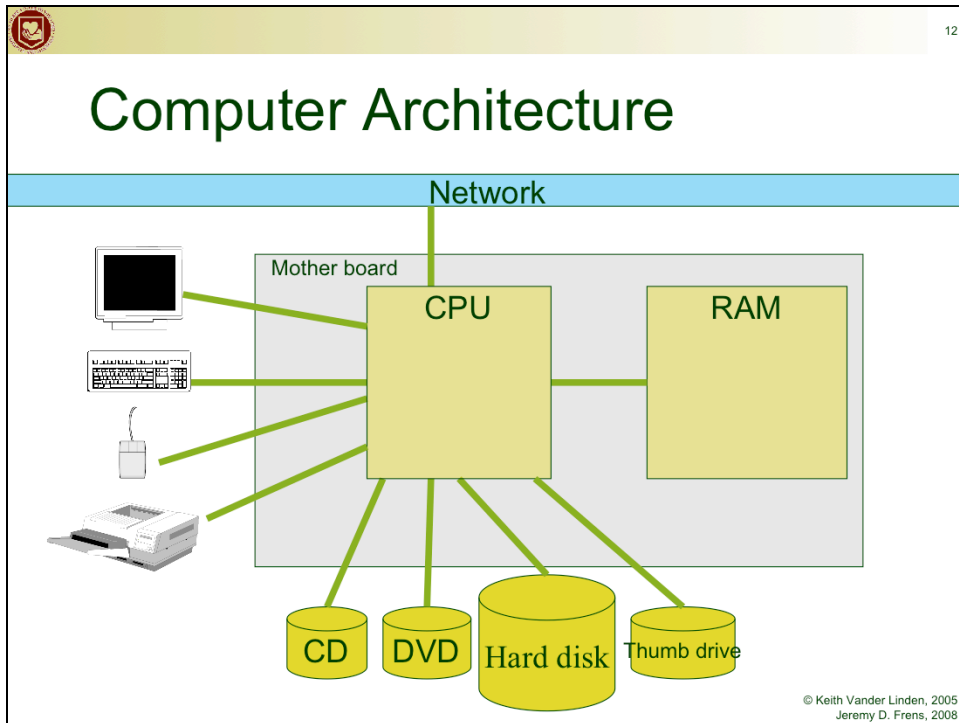

She was Countess of Lovelace and Lord Byron’s daughter. She was a supporter and mentor of Babbage.

The Universal Machine

- A computer is known as a **universal machine**.
 - It can compute *anything* that can be computed.
- Key ingredients in our universal machines:
 - Hardware: framework for “any computation”.
 - Software: describes a specific computation.
 - a communication with the computer.

Computers are universal devices, unlike hammers and other artifacts that are designed to do one thing.

- **CPU/Main Memory** - Find info on your machine's CPU (mouse-right on "My Computer" and choose "Properties"). You should be able to find all the info on your main memory and processor, but our lab may restrict part of that information.
- **System State** - Show the current system use (ctrl-alt-del and choose "Task List"). See what you can find about the current machine state here.
- **Secondary Storage** – Find the size of your hard drive and your other mounted drives. Double-click on "My Computer". Make particular note of the H: drive.
- **Peripheral devices** – Note the peripheral devices the system has. Note that the printer is mounted remotely and that you now have a print quota at Calvin.
- **Network** – Check the network connection speed (using the task manager opened above).
- **Software** – Check out the OS (using "My Computer" – "Properties") and the application programs as time allows.

Processors (CPU)

- Manipulate data/instructions from memory
- Three primary characteristics:
 - *word size*: the number of bits handled as a unit (32 or 64 bits)
 - *speed*: the number of machine cycles per second (2 - 4 GHz)
 - *cores*: numbers of processors in computer (2, 4, or more)
 - a single core can only do 1 thing at a time

The computer's speed/efficiency is based on these characteristics. To speed things up, increase the number of cores or the clock speed.

Least control over word size.

The Central Processing Unit (CPU) - You can find information on your MS Windows system processor in the system properties browser (start this tool by either clicking mouse-right on the "My Computer" icon on the desktop and choosing "Properties", or by choosing "Start"-"Settings"-"Control Panel"-"System").

Main Memory

- The processor manipulates data/ instructions in Random Access Memory (RAM).
- Properties of main memory:
 - Random access
 - Relatively fast
 - Volatile: needs electricity to work
- Technology:
 - current computers have 1 - 4GB of RAM

Usually RAM

Secondary Storage

- Mass, long-term storage
- Properties of secondary storage:
 - Slow
 - Non-volatile: no power required
 - Less expensive
- Technologies:
 - *Magnetic*: hard disk, tape
 - *Optical*: CD, DVD
 - *Solid state*: USB stick

Save early, save often!

NOISE TO SIGNAL
Rob Cottingham - socksignal.com/n2s

But I can't die yet. I have unsaved changes.

Memory Sizes

- Bit
- Byte
- Kilobyte (KB)
- Megabyte (MB)
- Gigabyte (GB)
- Terabyte (TB)
- Petabyte (PB)

Bit - A single 0 or 1

Byte - 8 bits: enough to store one character

Kilobyte (KB) – 1024 (2^{10}) characters: a paragraph of text

Megabyte (MB) - ~1 million (2^{20}) bytes: a book or a minute of mp3 audio

Gigabyte (GB) - ~1 billion (2^{30}) bytes: 16 hours mp3 audio, 20 minutes of DVD video

Terabyte (TB) - ~1 trillion (2^{40}) bytes: all the text in Calvin's library, or 150 DVD movies

Memory Sizes, CPU Speeds

RAM: You can use information quickly on books open on your table.

Bigger table = more RAM = more apps/files open at once

CPU: gets books (applications) and files from the bookshelves

Faster CPU = getting apps/files is faster

Hard disk: holds files and applications.

Bigger hard disk = more apps/files can be stored

Back ups!

- Both primary and secondary memory technologies are susceptible to faults.
- Back up RAM to hard disk with Ctrl-S (on Microsoft products)
- Back up hard disk periodically:
 - Use external drives.
 - Use on-line backup.

Impress upon them the importance of (psychotically) backing things up.

Your H: drive in the windows lab is a network drive that is backed up by CIT.
So is the Knightvision server.

Input/Output Devices

- To be useful, the computer must usually be expanded by additional devices:
 - e.g., monitor, keyboard, mouse, camera, printer, scanner, microphone, touchpad, etc., etc., etc.

Computer Software

- Software is composed of sets of computer instructions that:
 - prescribe **algorithms** to be performed by the hardware
 - are encoded and stored in computer memory using programming languages
- Basic types of software:
 - Operating Systems
 - Applications

Just summarize the basic types of software, without visiting the slides:

OS - manages the hardware/software of the computer, e.g., MacOS, Windows, Linux

Applications - support basic user tasks, e.g., Word, Excel, Dreamweaver, Powerpoint

Algorithms

- An *algorithm* is a set of abstract instructions for performing a task.
- Use three basic types of instructions:
 - **Sequence**: execute instructions in a particular order
 - **Selection**: execute some instructions and not others, depending on conditions
 - **Iteration**: execute instructions over and over and over

Algorithms are like recipes.

We'll see them used in a programming language in this week's lab.

```
print "Enter your name"
name = get_input()
while name == "":
    print "I mean it!"
    name = get_input()
if name == "Vic":
    print "Hey, Vic! Hi!"
```

Programming Languages

- *Programming languages* are used to encode algorithms in a computer's language.

- Types of programming languages:

- machine language

(directly executed by the CPU)

001110110100011100101011...

Code for moving data Code for data source and so forth...

- high-level languages

(translated to ML with *compilers*)

```
Speech = txtSpeak.Text
If Speech = "count to 10" Then
  For i = 1 to 10
    Peedy.Speak Speech
  Next i
End If
```

© Keith Vander Linden, 2005
Jeremy D. Frens, 2008

e.g., C++, Java, VB.net

Most of these students won't do much programming, so they probably won't need PL support on their machines.

Operating Systems

- Set of programs/utilities/libraries that manages the hardware and basic operations of the computer
- Common operating systems:
 - Microsoft Windows (e.g., XP, pocketPC)
 - Mac OS
 - Unix variants (e.g., Linux, Solaris)
 - PalmOS

images from www.microsoft.com, apple.com, kernel.org, palm.com, 2008
Jeremy D. Frens, 2008

OS Functions

- Loaded into memory when the computer is booted. It manages:
 - Programs
 - Memory
 - Files on secondary store
 - Peripherals I/O devices
 - Network connections

images from www.microsoft.com/applicationcenter/2008
Jeremy D. Frens, 2008

Programs

multi-tasking (show the processes and the applications in the task manager)

Memory

Loads files from disk when needed (show memory use in task manager)

Files on secondary store

keeps track of files on disk (discuss the A:, C:, and F: drives in windows explorer)

Peripherals I/O devices

"talks" to all the external devices

Network connections

maintains the network connection (if any) (show network connection in task manager)

Software Applications

- Programs built on top of the OS that support basic user tasks
- Common Applications:
 - Word Processing
 - Spreadsheets
 - Databases
 - Electronic Mail
 - Presentation Software
 - Web Browsing / Development

Moore's "Law"

CPU Transistor Counts 1971-2008 & Moore's Law

- Processing capacity for the price doubles every 18 months

image from [wikipedia](#), January 2009

© Keith Vander Linden, 2005
Jeremy D. Frens, 2008

There is some question as to whether this trend will continue and if it will ever hit a "wall". See Kurzweil.

Moving to multi-core changes speed-up claim.

Note the log scale on the left!!!! Exponential growth!!

The Digital Divide

- Not everyone has equal access to information technology.

- “I now realize how true it is that God does not show favoritism, but accepts men from every nation who hear him and do what is right.” - Acts 10:34-35

Key problems:

Computer technology costs money that people don't have.

Computer literacy costs money.

IT is decidedly western in structure and support (e.g., the world-wide-web is not really world-wide).
